Neuroanatomy of face processing

- Many regions involved in processing faces, but one of the most critical, and specific to faces, is the fusiform gyrus.
- Grill-Spector, Knouf and Kanwisher 2004, Nature Neuroscience, 7, 5, 555.

Neuroanatomy of face processing

- Haxby, Hoffman and Gobbini (2000; Trends in Cognitive Science, 4,6, 223-233)
- Three important regions
 - Inferior occipital gyri (OFA)
 - Lateral fusiform gyri (FFA)
 - Identity
 - Superior temporal sulcus
 - Representation of changeable aspects of faces- e.g. eye gaze.

Lingual gyrus
 Parahippocampal gyrus
 Fusiform gyrus

Haxby et al (2000)

Inferior occipital gyri
Early perception of facial features

Superior temporal sulcus
Changeable aspects of faces- perception of eye gaze, expression and lip movement

Lateral fusiform gyrus
Invariant aspects of faces- perceptions of unique identity

Intraparietal sulcus
Spatially directed attention

Auditory cortex
Prelexical speech perception

Amygdala, insula, limbic system
Emotion

Anterior temporal
Personal identity, name and biographical information

Emotional expressions

- Assessment
 - Ekman faces (Pearson's FEEST)

- TASIT (dynamic).

Deficits in facial emotion expression perception.

- The ability to interpret emotional expressions from the faces of other people can be impaired as a result of neurological damage.
- Studies have implicated posterior regions of right hemisphere.
- Some selective deficits associated with amygdala damage (fear perception) and with cortico-striatal-thalamic circuit damage (impaired perception of disgust in Huntington's disease).

How common are facial emotional expression deficits?

- Oliver Zangwill Centre Study (2003)
- 60 Ekman faces, 10 per emotion (Happy, Fear, Anger, Disgust, Sad and Surprise)
- Assessment of rate of impairment and nature of errors.
- Data from 104 patients, consecutive admissions to service for assessment; mixed aetiology.
- Compared with 90 controls, matched for age and IQ.

How common are facial emotional expression deficits?

- No difference between patients and controls on happiness and surprise
- Sad 18% impaired
- Fear 33% impaired
- Anger 20% impaired
- Disgust 18% impaired
- 53% of patients impaired on at least one emotion.

The aim of this analysis was to investigate the measurement properties of this tool with a view to developing a computer adaptive version.

Data from 194 patients were extracted from patient records, anonymised and entered into RUMM2030.

For the purposes of this analysis responses were coded as correct or incorrect,

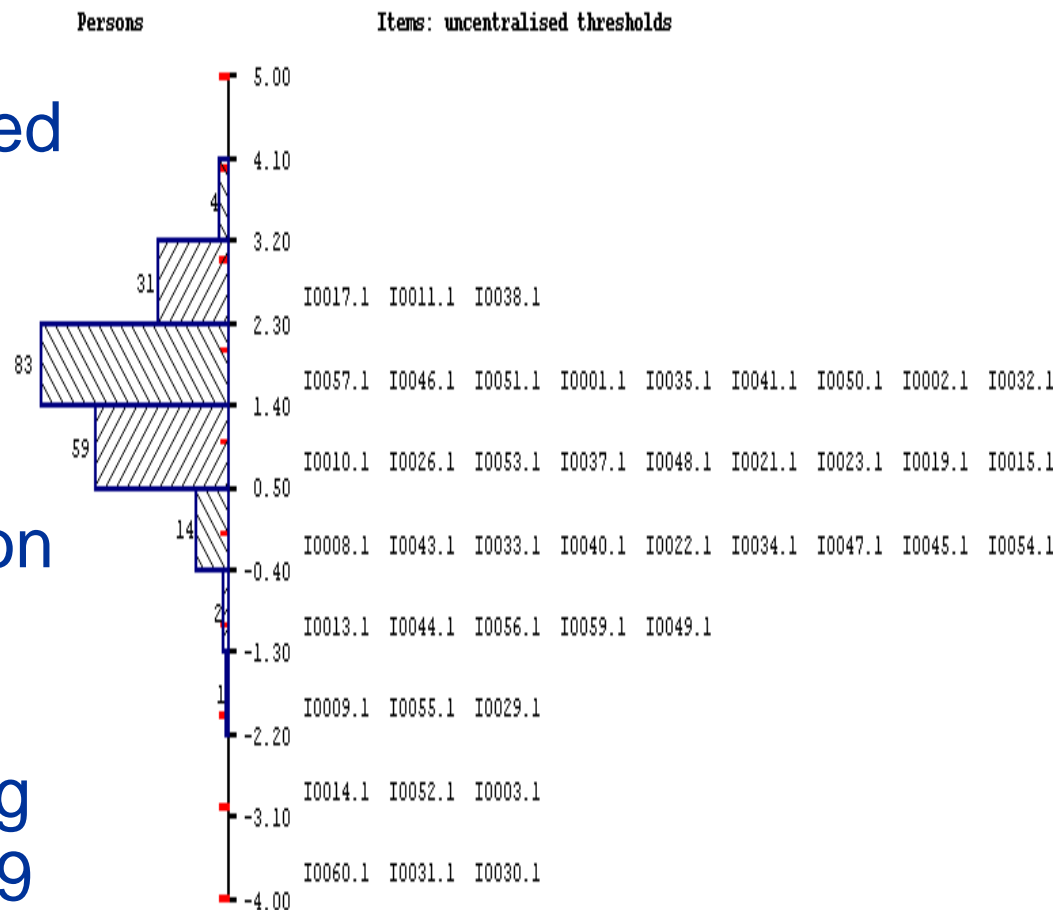

There's no specific a priori theory underpinning any potential distractor analysis. (advice needed about how to handle this issue)

63 (32.5%) patients scored a below the total score published cut-off of 42/60

The scale as a whole showed a significant item-trait interaction (Chi-Sq 174.38, $p < 0.0001$, d.f.120)

satisfactory reliability (Person Separation Index =0.84),

somewhat skewed targeting (mean person location +1.59 +/-0.83).

Happy

Persons

Rehabilitation of emotional expression impairments

- Some work in ASD
 - Baron Cohen –
 - Autism Research Centre
- Golan and Baron Cohen (2006)
- Development and Psychopathology 18, 591-617
- Training led to improvement on close generalisation tasks, but not distant generalisation tasks

Rehabilitation of emotional expression impairments

- Also work in Schizophrenia
 - Wolwer et al (2005; Schizophrenia research, 80, 295-303).
 - Russell et al (2007; BJCP, 45, 579-583)
 - Using METT
 - Also used Emotion matching task to test for generalisability.
 - Compared 20 Scz and 20 HC. Both improved with training. Scz group improved to pre-training levels of HC.

Rehabilitation of emotional expression impairments

- Acquired brain injury
- Bornhofen & McDonald (2008), *Neuropsychological Rehabilitation*, 18, 1, 22-44.
- 12 TBI patients, RCT design
- Treatment- 25 hours over 8 weeks.
 - Knowledge of emotion in common contexts
 - Judging static emotion cues
 - Judging dynamic emotion cues
 - Making social inferences from emotion cues.
- Treatment group showed evidence of greater improvement on several measures.

Conclusions and advice sought

- Individual subscales not “working”
- Some promise
- Luning has put the items into Concerto with a demo CAT version of the test now working...
